Backend Module Diagram for *elf*

Config file (*config.json*)
- defines all config parameters
  - logging
  - modules (start or not)
    - etc.

Init script (*init.js*)
- reads configuration file(s)
- starts all modules (APIs, daemons)

Modules (*modulename.js*)
- modules encompass API and daemons
  - module paths set in *config.json*
    - use Node.js include feature

APIs (*modulename.api.js*)
- modules that contain frontend (HTTP response) and backend for APIs
- Core functionality powered by daemons
- *Ex. "users" API takes RESTful API request from frontend interface to delete user, tells daemon to do so*

Daemons (*modulename.daemon.js*)
- modules that have scripts for core backend functionality
  - accessed by APIs to complete API requests
- *Ex: "users" daemon takes request to add user from API, adds user to database*
